It is not surprising, therefore, that in building construction, there are specific legal requirements that should be followed when such wiring is to be installed. Some of these requirements are not just for safety reasons but for the aesthetic appearance of the building. For example, wiring to be used in the ceiling or walls of a building or in the subflooring for a home should be concealed or non-visible, and you should specify that in your contract with the electrician who will be doing the work. The need to have the wiring hidden is a result of the fact that it is not to be visible from the outside of the building. It is a common misconception that wiring should not be hidden, but that is not the case. The fact that wiring is not to be seen should not be taken as license for the electrician to make any mistakes in the installation or in the wiring. If the wiring that is installed is not properly done, then it can be a safety hazard. The wiring should be properly marked and labeled, and care should be taken to ensure that wiring is not damaged or cut during the installation process. Also, it is important that electrical wiring that is to be used for the internal operations of a building should be tested to make sure that the wiring is functional. Electrical wiring has the potential to cause fires, so testing it to make sure it is safe to use is very important. The electrician who installs the wiring should be able to provide you with documentation that he has tested the wiring before installing it, or that he has done the testing and that he has no objection to you having the wiring tested.
